# Python

Python is a fully featured dynamic typed language that simplifies the development of software. It is an extremely robust and efficient programming language used for many enterprise level projects. Python boasts a massive selection of open source modules that can be imported into applications to gain instant functionality.

## Django Framework

Develop with the powerful Django Python Framework for small to enterprise level web applications. Django includes a robust template system, a web portal accessible admin interface, and complete development environment. The framework also provides a unified Data Access Layer (DAL) and a strong Object-Relational-Mapping (ORM) system which assist in data communication between a web application and a database server.

## Web2py Framework

Use the Web2Py framework's unique approach to web development to better focus efforts on coding software rather than setting up and managing boilerplate code. The framework offers a powerful web-based Integrated Development Environment (IDE) that can be used to manage web applications through a web browser. Moreover the framework includes a Scaffolding apps based on Bootstrap for useful client side demo functionality.
